

TURF FERTILIZER

BROADLEAF WEED CONTROL

Q3[®] Herbicide on Fertilizer

Award Turf Fertilizer Q3[®] Weed and Feed contains a combination of three proven weed control ingredients. This formula of 2,4-D, Dicamba and Quinclorac ensures control of the toughest weeds including already-germinated crabgrass. May be applied at all common application sites such as: residential turf, parks & athletic fields, golf course fairways & roughs, institutional sites and more.

Like conventional weed & feeds, this product needs to be absorbed by susceptible plants in order to be effective. For best results, delay mowing 2-3 days before application and apply when the grass is wet from dew or rain. However, with the active ingredient Quinclorac in our Q3[®] formula, your application site will stay clean of clover, dandelion and other tough weeds longer than those without.
